Overview

Tower of Fortune is a push-your-luck progression event where players choose from hidden options, collect rewards, and progress through increasingly valuable stages.

Players must balance risk and reward, deciding whether to Cash Out and secure their winnings or continue pushing for bigger prizes while avoiding Failure outcomes.

The feature is accessed using Tickets.

Goals

Business Goals

Increase overall monetization outside the core game economy

Create additional spending opportunities for whales and highly engaged players

Design Goals

Generate excitement through meaningful risk-versus-reward decisions

Encourage repeat participation through aspirational rewards and progression goals

Player Fantasy

"I've already won some rewards... should I risk going further for even better prizes?"

Feature Entry & Surfacing

Tower of Fortune is surfaced as a LiveOps feature through a dedicated entry point on the Home Screen.

First-Time Entry (FTUE)

When the feature becomes available to a player for the first time, an introductory flow is triggered automatically upon their first login during the active event period.

This flow strictly includes:

- Special Event popup.
- How-to-play infographic.
- Direct navigation to the feature (forces the player to the Tower of Fortune landing screen).

Daily Re-engagement & Login Flow

If a Ticket is granted as part of the Daily Login rewards, the Tower of Fortune daily reminder popup should be queued to trigger **immediately after** the Daily Login claim screen.

Note: To prevent potential popup fatigue, this behavior (whether the daily popup triggers, or if the game relies solely on the UI Notification Badge) must remain fully configurable through LiveOps.

Landing Screen Priority

Tower of Fortune participates in the Landing Screen / Event Notification system.

The following parameters are configurable through LiveOps:

- First-time entry behavior.
- Daily reminder behavior.
- Reminder frequency.
- Eligibility rules.
- Landing screen priority.
- Display order relative to other LiveOps events and popups.

Final popup ordering and conflict resolution with other features will be defined together with UX, Product, and Engineering teams.

Terminology

Term	Description
Failure	Outcome that interrupts the current run.

Safe Stage	Stage that cannot contain a Failure outcome.
Milestone Stage	Safe stage that has Special and Higher rewards.
Cash Out	Voluntarily ending a run and claiming accumulated rewards.
Continue	Resuming a failed run through an available recovery method.
Ticket	Resource required to start a new run.

Core Gameplay Loop

 Tower of fortune

Stage Structure

Stage Configuration

All stage parameters are configurable through LiveOps unless otherwise stated. (The values below represent the default configuration).

- **Total Stages:** 60 stages per run.
- **Number of Choices:** Configurable (min 2, max 4). Default is 4 hidden choices. The system supports adjusting this per stage through LiveOps to visibly alter difficulty for the player.
- **Player Action:** Players may select one choice per stage.
- **Revealing Options:** All unselected options must always be revealed to the player immediately after they make a selection, including during Safe Stages.
- **Outcomes:** Each choice contains either a Reward outcome or a Failure outcome.
 - **Failure Outcome Limit:** Only one Failure outcome (Pig) can appear per stage.
 - **Failure Placement:** The Failure outcome can appear randomly in any of the available choice positions.
 - **Empty Outcomes (Optional):** The system supports "empty outcomes" (no reward and no Failure). If enabled via LiveOps, their frequency and placement must be fully configurable.

Stage Types

Starting Stage (Stage 1) The first stage is always safe.

- **Default Rules:**
 - No Failure outcomes can appear.
 - All choices grant rewards.
 - Progression is guaranteed.

Standard Stages

The default stage type throughout the run.

- **Default Configuration:**
 - 3 Reward outcomes.
 - 1 Failure outcome.
- *Note: The number of available choices and the outcome distribution may be adjusted per stage through server configuration. Revealing a Failure immediately ends the run and triggers the Failure Flow.*

Safe Stages

Safe Stages are fully configurable. **The exact placement and frequency of Safe Stages (both regular and milestone stages) are fully configurable through LiveOps.**

- **Default Configuration:**

- Every 5 stages (5, 10, 15, 20, 25, etc.).
- Milestone “Safe Stages” (30, 60).

- **Default Rules:**

- No Failure outcomes can appear.
- All choices grant rewards.
- Rewards are typically more valuable than those offered in Standard Stages.
- Progression is guaranteed.

Final Stage Completion

Upon successfully completing Stage 60 (or the last stage we configured in LiveOps), all accumulated rewards are automatically claimed and the run ends.

The player is presented with the reward summary screen.

Visual Changes in each Stage

- Doors:
 - Waiting for player to select it: lights go on, blinking in an idle pattern (not too distracting)
 - Selected door with Reward: lights *and* frame on, yellow or green
 - Selected door with Pig: lights *and* frame on, red
 - Safe stage, waiting for player to select it: different idle pattern for the lights

Rewards

Reward Progression

Rewards increase in value as players progress through the run. Reward tiers, stage ranges, milestone locations, reward pools, and reward values are fully configurable through LiveOps. Higher stages should provide increasingly valuable rewards, while milestones serve as key progression targets that encourage players to continue pushing deeper into the run.

- **Reward Tiers:** By default, rewards are divided into six tiers, with progression to a new tier every 10 stages (Tier 1: 1–10, Tier 2: 11–20, Tier 3: 21–30, Tier 4: 31–40, Tier 5: 41–50, Tier 6: 51–60).
- **Milestones:** Default configuration sets Stage 30 as a Major Milestone and Stage 60 as an Aspirational Milestone. Milestone locations and rewards are fully configurable.

- **Reward Distribution:** There are no hardcoded tier restrictions for specific reward types.

Reward availability is fully configurable through LiveOps.

- **Reward Pool**

- Coins
- Boosters
- Power-ups
- Avatars
- Unlimited Lives
- Album Badges
- Event Tokens
- Event Tickets
- Dream Album Envelopes

- **Future Rewards**

- Skins
- Frames

Failure & Continue System

Failure Outcome

When a Failure outcome is revealed:

- **Immediate Effects**

- The run is interrupted.
- All rewards accumulated during the current run are at risk.
- The selected choice is revealed as the Failure outcome.

- **Player Choices**

- **End Run:** The run ends. All rewards accumulated during the current run are lost.
- **Continue Run:** Players may continue using one of the available continue methods. Possible continue methods include:
 - Rewarded Advertisement (FUTURE IMPLEMENTATION)
 - Premium Currency

After continuing, all accumulated rewards remain preserved, and the run resumes from the point of failure.

Continue Configuration

Continue behavior, availability, costs, and escalation rules are fully configurable through LiveOps.

- **Configurable parameters include:**

- Continue availability.
- Continue methods.
- Continue costs.
- Cost escalation.
- Advertisement eligibility. (FUTURE IMPLEMENTATION).
- Premium Currency requirements.

- **Cost Escalation Rule:** Continue costs must increase after each consecutive use within the same run. The specific escalation curve is configurable through LiveOps.

Continue Resolution

When a Failure outcome is revealed, the selected choice is permanently revealed as the Failure outcome.

- **If the player chooses to Continue:**

- a. The Failure outcome is removed from the stage.
- b. The player may select one of the remaining unrevealed choices from the same stage.
- c. **Since each stage contains only one pig**, paying to continue eliminates the pig and guarantees a reward on the remaining choices. Once selected, the reward is granted, the stage is completed, and the player advances to the next stage.

- **If the player declines to Continue:**

- a. The run immediately ends.
- b. All rewards accumulated during the current run are lost.
- c. The player returns to the feature home screen.

Cash-Out System

Cash Out allows players to end the current run and claim their accumulated rewards.

Cash-Out Benefits

- Claims all accumulated rewards.
- Ends the current run.
- Removes all future risk.

Voluntary Cash-Out

Players may **exit the run after any successful stage.**

Rules

- **Available after every successful stage.**
- Claims all accumulated rewards.
- Ends the current run.

Entry System & Availability

Access to Tower of Fortune is controlled through Tickets. All ticket storage, acquisition methods, and availability settings are fully configurable through LiveOps.

Ticket Economy & Rules

- **Ticket Cost:** The number of Tickets required to start a run is configurable (1 by default).
- **Storage Limit:** There is no overall storage limit or maximum capacity for Tickets in the player's inventory.
- **Ticket Sources:** Tickets may be obtained through Daily Login rewards, Event rewards, Shop offers, Special promotions, or other LiveOps-defined sources.

Deployment Models & Segmentation

- **Deployment:** The feature should support multiple deployment models configurable via LiveOps, such as a permanent feature, recurring LiveOps event, or limited-time event.
- **Segmentation:** Availability should ideally be controlled through LiveOps segmentation (e.g., Player level requirements, post-onboarding availability, targeted player segments, or full rollout to all players).

Feature Unlock, FTUE & Triggering Logic

To prevent placement conflicts and ensure optimal player onboarding, feature access and onboarding are driven non-intrusively via the Home Screen widget.

- **First-Time Acquisition & Forced FTUE (Strictly Once per Lifetime):** When the player receives their very first Ticket, a dedicated widget appears on the Home Screen with an active notification pip, accompanied by a hand pointer to guide the player. Tapping this widget for the first time triggers the onboarding flow:
 - a. **Intro:** Brief visual/narrative introduction to the feature.
 - b. **Info Pop-up:** Overview of ticket mechanics and potential rewards.

- c. **First Gameplay:** Drops the player directly into the core loop on the Tower of Fortune landing screen.
- **Subsequent Ticket Acquisitions:** Receiving any subsequent tickets (from Daily Logins, LiveOps, or events) will **not** trigger the hand pointer, pop-ups, or onboarding flow again. Instead, ticket receipt subtly updates the notification pip on the Home Screen widget. Tapping this widget routes the player directly to the Tower of Fortune landing screen to consume their ticket. Players can re-read the rules anytime via the in-game Info Pop-up.

Event-Driven Notifications

There are no direct push notifications purely for ticket availability. Instead, players are notified when a new Event or Special Promotion begins (e.g., "Mighty Doors available!"). Tickets act as the premium hook and top-tier reward within these LiveOps events.

Difficulty & Risk Curve

The feature should create increasing tension as players progress through a run while maintaining the feeling that a successful run is always possible.

The exact risk curve, expected progression depth, reward distribution, continue economy, and overall feature economics will be defined and tuned by the Economy and LiveOps teams.

Design Principles

- Early stages should feel approachable and encourage participation.
- Risk and reward should increase as players progress.
- Players should regularly experience meaningful progression.
- Deep runs should feel exciting and aspirational.
- Failure should remain possible at any stage where Failure outcomes are enabled.
- The perceived chance of success should remain high enough to encourage continued play.
- Difficulty may be adjusted through multiple mechanisms, including reward values, reward distribution, stage composition, and the number of available choices presented to the player.

Configurable Parameters

The following parameters are configurable through LiveOps:

- Total stages.
- Reward tiers and values.
- Duration of the event.
- Reward pool composition.

- Safe Stage frequency and placement.
- Milestone locations and rewards.
- Ticket sources.
- Active Cash-Out variant.
- Continue configuration.
- Number of choices per stage.
- Outcome distribution per stage.

UX Flow & Screens

Screens

! These wireframes are structural concepts for layout reference only. Final artwork, graphics, and visual design will be refined later. Please focus on the core UI elements and copy.

Analytics

The following analytics should be split by player behaviour and spending, such as new players, engaged players and spenders.

- **Event Start & Entry:** Track when players enter the event lobby, start a session, and utilize ticket versus hard currency attempts.
- **Funnel Progression (Floor by Floor):** Track player progress by logging events for every floor reached, doors selected, and rewards added to the temporary prize pool.
- **Fail States & Revives (The Pig Loop):** Track each time a player hits the Pig, logging the current floor number and their action choice (spending Gems to Continue vs. Abandoning).
- **Cash-Out Conversion:** Track voluntary exits, logging the exact floor number where the player chose to Cash Out and the final list of claimed rewards.
- **Economy Sinks & Sources:** Record total hard currency spent per session, alongside all items disbursed into the player's inventory when the players exits/complete the run.

The following metrics should be tracked:

Participation

- Runs Started (check the distribution of ticket sources)
- Unique Participants.
- Participation Frequency (based on active days in the game)

Progression

- Average Stage Reached.
- Failure Stage Distribution.
- Stage reach rate (regular, safe and milestones)

Player Decisions

- Cash-Out Usage.
- Cash-Out Stage Distribution.
- Continue Usage.
- Continue Conversion Rate.

Economy

- Tickets Consumed.
- Ticket Acquisition Sources (if applicable, add offers too)
- Reward Distribution.

Monetization

- Rewarded Advertisement Continues.
- Premium Currency Continues.
- Revenue Generated by the Feature.

Audio & SFX Requirements

To properly convey the push-your-luck fantasy and the increasing tension, the feature requires specific audio assets tied to the new thematic wrapper.

The audio design follows a **TV Game Show** aesthetic (highly theatrical, high-stakes, and celebratory). Audio is a critical tool to drive the "push-your-luck" psychological loop. The soundscape must balance the suspense of a televised studio under spotlights with immediate, clear feedback for wins, losses, and milestone safety.

Background Music (BGM) Tracks

The event utilizes two distinct, mutually exclusive music loops. The transition between them must be immediate to shift the emotional state of the player.

- **TV Show Tension Loop (Standard Floors):** An upbeat, rhythmic game-show theme track that loops during standard gameplay. It sounds mysterious yet driving, capturing the vibe of a TV studio under tension.
 - **Bonus Round Theme (Safe Stages):** A glamorous, high-energy, and brass-heavy TV theme (big band/jazzy funk). It triggers instantly upon entering a Safe Stage, cutting the tension loop entirely to signal immediate safety and relief.
-

Audio Events Matrix (Separated by Screen)

Stage Screen (The Main Stage)

- **Choice Lock-In:** A snappy, high-impact electronic button click when the player taps a door to "lock in" their choice before it opens.
- **Anticipation Drum Roll:** A brief, dramatic TV-show drum roll or rising sound lasting exactly 400ms while the door is opening to build maximum suspense.
- **Standard Reward Reveal:** A classic, satisfying game-show chime paired with a short "Ding!" when a booster or currency pops out of the door.

- **Empty State Reveal:** A comical, slightly vintage TV "wah-wah-wah" muted trumpet sound or a soft buzzer when a door contains "Nothing".
- **Prize Travel (HUD):** A quick, standard "whoosh" sound while the reward icon physically moves from the opened door down to the bottom prize tray.
- **Prize Deposit (HUD):** A simple game-show coin or bell sound when the item lands in the prize pool tray and updates its quantity counter.

Safe Stage Screen (The Bonus Round)

- **Jackpot Celebration:** The ultimate game-show win confirmation. An exaggerated, explosive combination of bells, studio applause, and a grand brass fanfare when claiming rare milestone drops or envelopes.

Failure Screen (The Game Over Overlay)

- **Losing Horn & Pig Laugh:** A loud, jarring TV-show losing buzzer combined with a mocking grunt or laugh from the Bad Piggy.
- **BGM Behavior Rule:** This sound effect must instantly cut the active gameplay music loop to absolute silence, leaving only the echo of the buzzer and a disappointed collective "Aww" groan from a virtual studio audience.

Revive Modal (The Second Chance)

- **Back in the Game Jingle:** A magical, rising musical sound effect signaling that the player has successfully used a revive, saved their progress, and returned to the stage.

Cash-Out Modal (Walking Away)

- **Prize Jingle:** A celebratory cash-register chime paired with enthusiastic studio audience applause as the player successfully exits the run voluntarily with their accumulated loot.

Questions

///// General Configuration

Which elements of the system should be configurable?

Total stages, reward tiers and values, reward pool composition, Safe Stage frequency and placement, milestone locations, Ticket sources, active Cash-Out variant, Continue configuration, and event duration must be fully configurable through LiveOps.

[Mighty Doors \(DB Tower of Fortune\) | Stage Configuration](#) [Mighty Doors \(DB Tower of Fortune\) | Configurable Parameters](#)

Should the number of available choices be configurable?

Yes. The default value is 4 choices, but the system must support adjusting this per stage (e.g., 2, 3, or 4 choices) to visibly alter difficulty.

[Mighty Doors \(DB Tower of Fortune\) | Stage Configuration](#) **Number of choices**

Can multiple Pigs appear at the same time?

No. Only one Pig can appear per stage.

[Mighty Doors \(DB Tower of Fortune\) | Stage Configuration](#) **Failure Outcome Limit**

Should Safe Stages be configurable?

Yes. Placement and frequency of Safe Stages must be configurable through LiveOps.

[Mighty Doors \(DB Tower of Fortune\) | Stage Types](#) **Safe Stages**

Can a choice reveal an empty outcome (no reward and no Failure)?

Yes. If enabled, it must be configurable through LiveOps.

[Mighty Doors \(DB Tower of Fortune\) | Stage Types](#) **Empty Outcomes**

Can the Failure outcome appear in any of the four positions?

Yes. The Pig can appear randomly in any of the available choices.

[Mighty Doors \(DB Tower of Fortune\) | Stage Types](#) **Failure Placement**

///// Cash-Out System

Should Cash-Out be available after every stage or only at Safe Stages?

Every stage.

Should unselected options always be revealed after a choice is made?

Yes. All unselected options must always be revealed, including on Safe Stages.

[Mighty Doors \(DB Tower of Fortune\) | Stage Configuration](#) **Revealing Options.**

Should the active Cash-Out variant remain configurable through LiveOps?

No.

///// Tickets Economy

How many Tickets are required to start a run?

Configurable (1 by default).

[Mighty Doors \(DB Tower of Fortune\) | Entry System & Availability](#) **Ticket Economy & Rules.**

Should players have a maximum Ticket capacity?

No. There is no overall storage limit.

[Mighty Doors \(DB Tower of Fortune\) | Entry System & Availability](#) **Ticket Economy & Rules.**

Should automatically generated Tickets have a storage cap?

No.

[☐ Mighty Doors \(DB Tower of Fortune\) | Entry System & Availability](#) **Ticket Economy & Rules.**

///// Continues

Should there be a limit on the number of Continues per run?

No. Not limit as default.

Should Continue costs escalate after each use?

Yes. Costs must increase after each Continue, utilizing a LiveOps configurable escalation curve.

[☐ Mighty Doors \(DB Tower of Fortune\) | Failure & Continue System](#) **Cost Escalation Rule.**

///// Availability & Access

Is Tower of Fortune intended to be a permanent feature, recurring event, or limited-time event?

It must support multiple deployment models configurable via LiveOps.

[☐ Mighty Doors \(DB Tower of Fortune\) | Entry System & Availability](#) **Deployment Models.**

When does the feature become available to players?

Availability is ideally controlled through LiveOps segmentation (e.g., player level requirements, post-onboarding).

[☐ Mighty Doors \(DB Tower of Fortune\) | Entry System & Availability](#) **Segmentation.**

/////Rewards

Should specific reward types be restricted to specific reward tiers?

No fixed restrictions. Reward availability is fully configurable with no hardcoded limitations.

[☐ Mighty Doors \(DB Tower of Fortune\) | Rewards.2](#) **Reward Distribution.**

///// Online / Offline & Persistence

Is the feature available offline?

No, it is an online feature requiring server validation.

[☐ Mighty Doors \(DB Tower of Fortune\) | Run Persistence](#)

What happens if the player closes the app during an active run?

The run state is saved exactly where they left off. The player is forced to continue upon reconnection.

[☐ Mighty Doors \(DB Tower of Fortune\) | Run Persistence](#)

What if the calendar event ends? Should the behavior then be that the player is forced to go to the tower of fortune to either cash out or continue?

Yes, if online, they are forced to manually choose. If offline, the server executes an Auto Cash-

Out, delivering rewards to the inbox.

[☰ Mighty Doors \(DB Tower of Fortune\) | Run Persistence](#) **Event End Behavior.**

Configuration

Which elements of the system should be configurable?

- Total stages.
- Reward tiers and reward values.
- Reward pool composition.
- Safe Stage frequency and placement.
- Milestone locations and milestone rewards.
- Ticket sources.
- Continue configuration.
- Event duration.

Should the number of available choices be configurable?

Yes.

Default value: 4 choices.

The system should support a configurable number of choices per stage, for example 2, 3, or 4 choices. This allows difficulty and risk to be adjusted in a more visible and understandable way for the player.

Can multiple Pigs appear at the same time?

No.

Only one Pig can appear per stage.

Should Safe Stages be configurable?

Yes.

Safe Stage (regular and milestones stages) placement and frequency should be configurable through LiveOps.

Can a choice reveal an empty outcome (no reward and no Failure)?

Potentially yes.

An empty outcome could be introduced as an additional outcome type.

If enabled:

- It should be configurable through LiveOps.
- The amount/frequency should be configurable.

Can the Failure outcome appear in any of the four positions?

Yes.

The Pig can appear in any of the four available choices.

~~Cash-Out~~

~~Should Cash-Out be available after every stage or only at Safe Stages?~~

~~A/B Test Required~~

~~Two variants should be tested:~~

~~Variant A~~

- ~~• Cash-Out available after every successful stage.~~

~~Variant B~~

- ~~• Cash-Out available only on Safe Stages.~~

Should unselected options always be revealed after a choice is made?

Yes.

All unselected options should always be revealed after the player makes a selection, including on Safe Stages.

Should the active Cash-Out variant remain configurable through LiveOps?

Yes.

The active Cash-Out implementation should remain configurable through LiveOps even after the A/B test concludes.

Tickets

How many Tickets are required to start a run?

Configurable. 1 by default.

Should players have a maximum Ticket capacity?

No. There is no overall storage limit for Tickets.

Continues

Should there be a limit on the number of Continues per run?

No. Should be configurable.

The maximum number of Continues may vary depending on:

- Whether the player has additional Tickets available.
- The payment methods supported for Continues (e.g. Tickets, premium currency, watching ads, etc.).
- Economy balancing considerations.

The system should support a **configurable maximum number of Continues per run through LiveOps**, including the ability to have **no limit** if desired.

Decision Pending. Further definition required once the Continue economy is finalized.

Should Continue costs escalate after each use?

Yes.

Continue costs should increase after each Continue.

The escalation curve should be configurable through LiveOps.

Availability & Access

Is Tower of Fortune intended to be a permanent feature, recurring event, or limited-time event?

LiveOps configurable.

The feature should support multiple deployment models:

- Permanent feature.
- Recurring LiveOps event.
- Limited-time event.

The initial recommendation is to manage availability through LiveOps.

When does the feature become available to players?

Preferred approach: LiveOps Segmentation

Availability should ideally be controlled through LiveOps segmentation.

Examples:

- Player level requirements.
- Post-onboarding availability.
- Targeted player segments.
- Full rollout to all players.

Rewards

Should specific reward types be restricted to specific reward tiers?

No fixed restrictions.

Reward availability should be fully configurable through LiveOps.

Example configuration:

- Early tiers: Coins, Boosters.
- Mid tiers: Event Tokens, Unlimited Lives.
- Late tiers: Cosmetics, Frames, Skins.

However, no hardcoded tier restrictions should exist.

Online / Offline

Is the feature available offline?

No. Its an online Feature.

Gameplay actions should require:

- Active internet connection.
 - Server validation.
-

Run Persistence

What happens if the player closes the app during an active run?

Possible options:

- Run is saved and can be resumed later.
- Run automatically ends.
- Custom recovery behavior.

The team has ruled out the options of losing the run entirely or making resuming it optional. The final consensus is that **the run state is saved and the player is forced to continue.**

Here is exactly how the flow must work:

- **Force-Close:** If a player closes the app in the middle of a run, the state is saved exactly where they left off. No progress or accumulated loot is lost.
- **Forced Return (Online Reconnection):** Upon the next login with an internet connection (or the moment the game detects an active connection again), the system must trigger a forced flow that pulls the player directly back into the event popup to resume their run.

- **Offline Edge Case:** Because this mode requires a connection, if the player logs in offline, they will be taken to the main menu. The run remains "frozen" and locked. If they tap the event icon, they will get a visual prompt (e.g., "You have a run in progress! Connect to the internet to continue"). The moment their connection is restored, they will be forced back into the run.

Event End Behavior: Design team proposed an "**Auto Cash-Out**" system (sending accumulated rewards to the player's inbox if the event timer expires while the app is closed).

@Johannes Hidén asked @Maros Urbanec didn't share his opinion yet.

[IF LINKED TO A DREAM ALBUM SEASON]

Event End Behavior (Resolved): The proposed "Auto Cash-Out" system is approved, but strictly as a fallback mechanism for edge cases to maintain economy stability and prevent time-manipulation exploits.

- **Standard Flow (Online):** If the player is active when the event timer expires, the game forces an immediate visual redirection to the Tower of Fortune. The player must manually choose to **Cash Out** (converting remaining Album items into standard rewards) or **Continue** (spending Hard Currency for a final draw).
- **Edge Case Fallback (Offline/Crash):** If the app crashes, loses connection during this forced flow, or the event expires while the app is closed, the server will automatically execute an **Auto Cash-Out**.
- **Resolution:** Upon the player's next login, the system will bypass the Tower of Fortune completely and deliver the converted standard rewards directly to the player's Inbox. **The final conversion rates for these rewards will be defined by the Economy team** to ensure balance is maintained and pity-system thresholds cannot be bypassed. Server-side verification is mandatory for all end-of-event actions.

What if the calendar event ends? Should the behaviour then be that player is forced to go to the tower of fortune to either cash out or continue.

We actually covered this edge case in the **Run Persistence** section under **Event End Behavior**.

To summarize, we have a two-step approach depending on the player's connection status:

1. **Standard Flow (Player is active/online):** Yes, exactly as you suggested! If the event timer expires while they are playing, the game forces an immediate visual redirection to the Tower of Fortune. They are forced to manually choose to Cash Out or Continue.
2. **Edge Case Fallback (Player is offline / app closed):** If the event expires while they are not in the game, the server will automatically execute an "Auto Cash-Out." Upon their next login,

they will receive their accumulated rewards directly in their Inbox to prevent them from losing their progress or bypassing event timers.

You can check the exact technical flow in the document under *Run Persistence > Event End Behavior*

Cash-Out Default Experience

Which Cash-Out variant should be the default experience after testing?

Options:

Option A

- Cash-Out after every successful stage.

Option B

- Cash-Out only at Safe Stages.

A/B testing should determine the default implementation, while keeping the system configurable through LiveOps.
