Changelog

May 21, 2024 Created document with content from the [design pitch presentation](#).

May 22, 2024 Added details in the analytics, configurations and offline behaviour topics. Added screen flow, screenshot references. Added Event Variations segment (WIP)

May 24, 2024 Update mockups and specs based on the Design Critique feedback.

Jun 4, 2024 Added screen flow when reward is a chest, added UI mockups to show chests and tool tips.

Jun 25, 2024 Updated flow to match the new closing button rule (from milestone progression screen to meta)

Jun 28, 2024 Added Economy Design section and a note from @Former user (Deleted) in the dynamic segmentation topic (analytics section).

Hypothesis

“We believe that **[by introducing a seamless, frequent progression event with multiple variations that engage players daily with new challenges]**,”

we can create a new lane in LiveOps calendar which can **[steadily, permanently increase level wins → monetisation opportunities → ARPDau by 5%]**

for **[our power & achiever players]**”

[Pitch Deck Here](#) / [Jira Ticket Here](#)

Goals

WHAT 💡

A new single player event where players need to complete a series of requirements to reach milestones and get rewards.

WHY 🤔

Why is this good for the Business?

Problems

- Players **lack single-player goals that have frequent progression** & refresh to start again + have low intrusion. We want a player to always have a goal, **progress after every level** while having low intrusion to the gameplay, without a need for extra pop-ups
 - On a daily basis, player progression is mostly felt in the season pass
 - Competition events can add a sense of daily progression but are quite intense
 - It's a very long term event where player might feel overwhelmed by the # of challenges
- Most events are only progressed by level wins - **no in-core actions matter at the moment**
- **Players** get tired from events fairly quickly & **need variety** ([EM conversion down by 10 percentage points after 10 uses](#))

Opportunities

- **Increased engagement** → increased opportunities for OOM conversions
- Event without needing to open pop-ups to progress increases **feeling of momentum** for the player

Why is this good for Players?

More events to play, less friction in the flow.

Feature Breakdown

Flow

- Event popup is shown, where players see what they need to collect.
 - Infographic tutorial opens automatically, for one time only. Tap to continue to see the event popup again.
 - This is the **only popup that opens automatically in this event**. Everything else is optional.
 - **Only in this first time**, the popup doesn't show a close button.
 - If players click **either** on the progression bar or the grand prize, they'll open the event milestone progression popup (where they'll see all milestones to be reached).
 - Closing the milestone popup goes back to the main event screen.
- Meta badge appears
- Player goes through the usual level flow
 - In level feedback: a small + {bubblecount} tool tip appears when players collect matchables by either making matches or explosions.
 - {bubblecount} refers to the amount of matchables collected with the move.
 - Nice to have: if an explosion happens or chain reaction, we can show a score tool tip with a delay (e.g. "+40", like in an arcade game or the existing "awesome" text in level feedback)
 - Player fails a level: a loss aversion screen is shown to players, where they'll

Example Image(s)

see a message saying that the collected pieces from this level will be lost if the level is not completed.

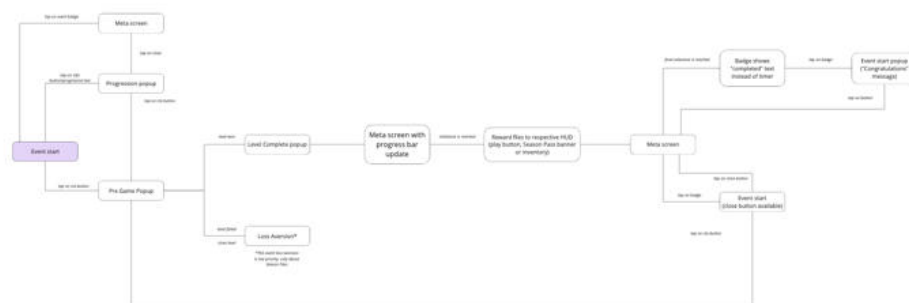

- *This loss aversion screen has a low priority, only on top of Season Pass but after all other events.*
- *Player wins a level: regular flow until going back to meta screen*
- *Level complete: shows the amount of pieces collected for this event;*
- *Meta screen updates the collected pieces*
 - *Progression bar is animated, appearing and collapsing under the badge (duration 1 to 2 seconds);*
 - *Whenever players come back to meta (from a level, from another tab in the navigation bar, etc) they should see the progression bar animation.*
 - *This animations shouldn't prevent players to tap on anything;*
 - *When **fill up to 80%** (configurable percentage) the progress bar and/or event badge gets a glow or other visual effect to show players they're close to getting a reward.*
 - *If a single reward is reached, a simple "flying token" animation shows that the reward was collected.*
 - *No need to overlay or add a claim button.*
 - *If a chest is reached, the usual chest overlay should be shown.*

- The reward cycle repeats from the start in case more rewards are reached after one level won.
- If players click on the badge, they'll see the event popup (close button available).
- If we decide to implement a "double token" reward in the event, this **will only affect this event** (differently from the reference from Royal Match).

Important notes: our core game doesn't allow us to ask for a single color of matchable or single mechanic as a requirement. Despite having colors with +80% appearance in levels, we have gaps as big as 9, 10 levels without said matchable color. At the moment we **don't** want to touch the core to fit this event.

FTUE, Flows and Wireframes/Mockups

Screen Flow

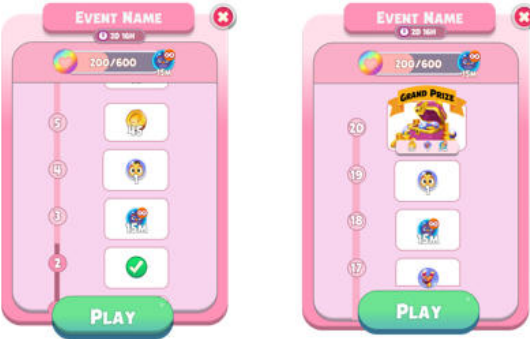

Mockups

Event start (no close button)

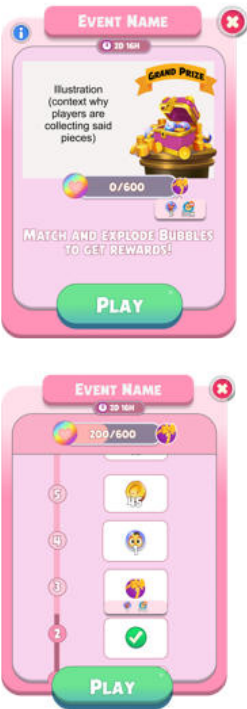

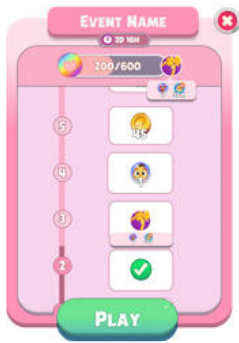

Event start (close button available)

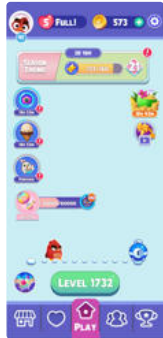

Milestone with more than 1 reward

If players click on the chest in the progression bar they should see a tool tip with the rewards. In the progression lanes we'll show the rewards at all times.

Meta screen badge and progress bar

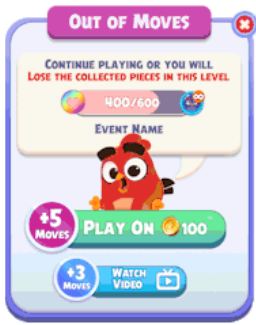

Level Complete popup

Loss Aversion

(Gif, please click on it to see it 😊)

Event Complete popup

In level

Single Match

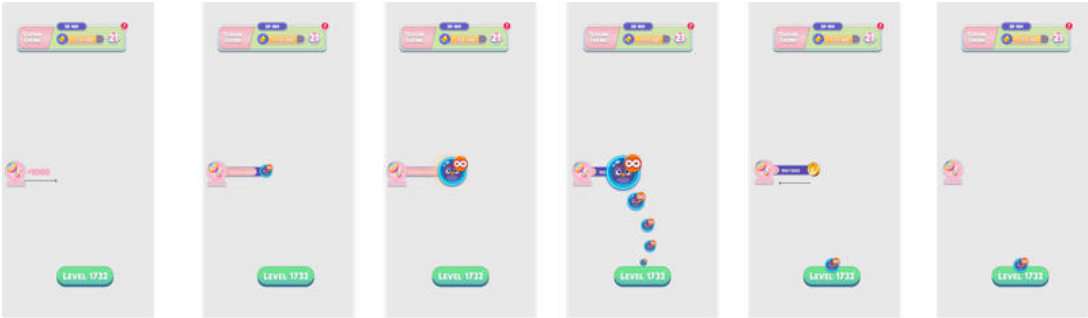

Multiple explosions/chain reaction (nice to have)

In scenarios like the one below, a +{bubblescore} tool tip would appear at the end of the chain, with a small delay.

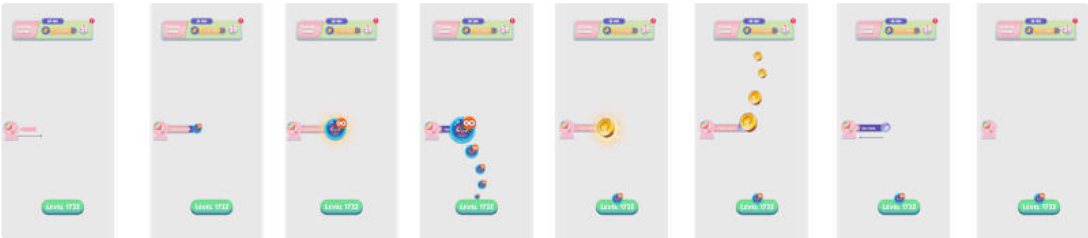

Reward animation flow

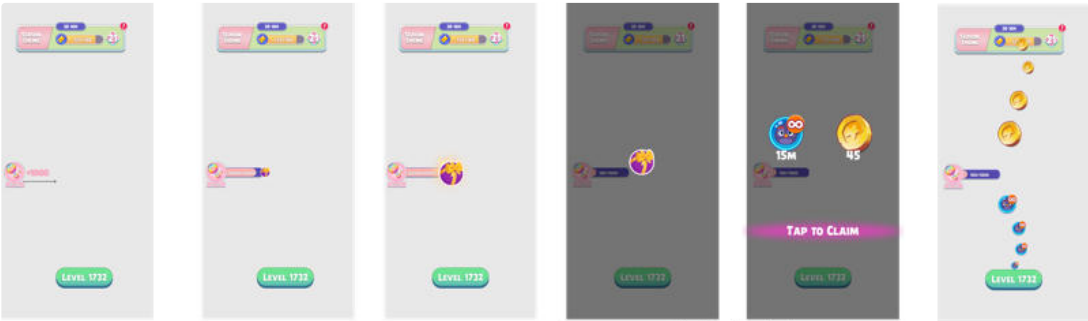

Single milestone is reached

Multiple milestones are reached

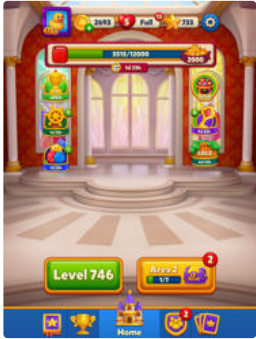

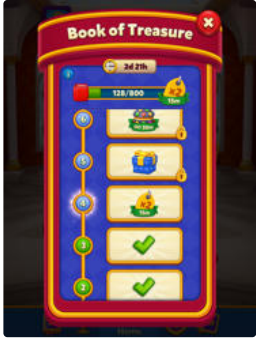

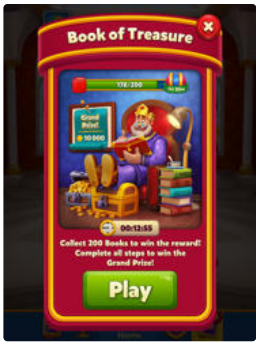

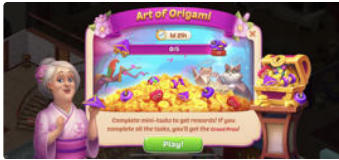

Milestone has a chest as reward

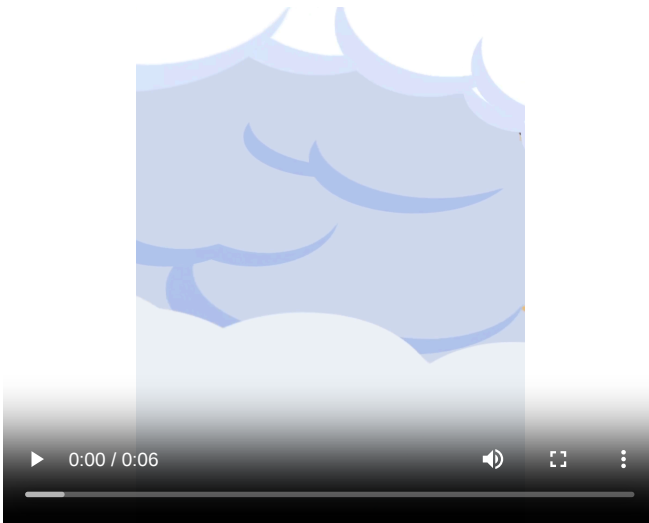

Chest opening animation without player's input

References

Progression bar animation in meta

Event Variations - for the future

In the future we want to have more variations of this event. They are:

- Create birds;
- Collect moves left;
- Collect specific mechanics;
- Destroy pieces.

Economy Design

[Click here](#) to see the requirements and rewards for this event.

Analytics

We want to track:

- The highest milestone reached/amount of milestones reached;
- How far players were to the next milestone;
- Player velocity per active event day.

NICE TO HAVE/ STRETCH GOAL

AB test experiment with dynamic segmentation.

Example:

Variant A (control): static variant, where the grand prize goes to top 0.1% of players

Variant B (dynamic segmentation): starts with static variant (A) on the first day. In the second day the requirement for each milestone becomes dynamic (let's use "EventTimeLeft" to do so).

- When implementing the dynamic segmentation, **make sure to change the [milestone requirements to meet round numbers](#)** (70, 85, etc).

Offline Behaviour

Players need to be online to:

- Get the event and see the event start.

Players can be offline to:

- Progress in the event;
- Collect rewards.

Beacon Configurations

We want to be able to configure in Beacon:

- Amount of milestones;
- Requirements for each milestone;
- Rewards (this can include more than 1 prize per milestone);
- Visual feedback when reaching {number} percent of the progression bar;
- Dynamic Segmentation through game parameters.

Future Improvements

- Doubler reward (2x), **only affecting this event**;
- Timed rewards: if players reach this next milestone in 15 minutes, they get 2 of the same reward instead of 1;
- Animated illustration in the main screen;
- Rainbow trail on the in-level tool tip;
- Dynamic Segmentation.

Q&A

Write down all the tricky questions that came up during the planning and during the development. Also, remember to write down the answers. This way you can come back to the document and find the answer to a tricky question you solved half a year ago.

Question #1

- (dev) Can we trigger the event after 1 level played (so players have already progressed in the collection)?

Answer #1

Yes.

Question #2

- *Can we use game parameters in Beacon to set the dynamic segmentation?*

Answer #2

It could be done. Server needs to have some information about the limits.

Question #3

- (art) Can we show a tool tip + {bubblecount} in meta instead of flying tokens? (dev) Can this be shown at the same time as other tokens are flying?

Answer #3

Yes and yes. We will process this event first and overlap the animations with the other tokens.

Question #4

- (Audio) Do we need a new SFX for this event or can we use the existing ones from previous events (such as wager, jigsaw puzzle, etc)?

Answer #4

No, audio team will use existing SFX for this event.

Feature Screenshots
